

Backup

ProcessGuard saves all its configuration (and GUI password) in the following file:

"C:\Windows\system32\pguard.dat"

ProcessGuard saves all hashes of the always allowed or always denied executable files in the following file:

"C:\Windows\system32\pghash.dat".

Configure Process Guard

for "services.exe", under "other options", the default setting is to have "install driver/services" checked with none of the other options there checked..

however, it is advised to not have "install drivers/services" checked (for "services.exe").. the problem is that many times, "services.exe" wants to legitimately install drivers/services.. so, in that case, you can leave it checked, or you will have to switch the setting back and forth..

most people would probably leave it checked, but i recently started trying to switch the setting, back and forth.. so, i have to switch it on before starting a certain program, and then switch it off after i have started the program..

I only have one program that requires that services.exe be allowed to install a driver/service, AOL..
